Analysis specifies what the system should do. Systems Design It is a process of
planning a new business system or replacing an existing system by defining its
components or modules to satisfy the specific requirements.~~***

~~System Analysis and Design – Overview – Tutorialspoint~~

System analysis can be defined as a deep analysis of a part of a structure of a module which is been designed before. System design means to make any module or a part of the structure from scratch and build it completely without estimation. System analysis is the process which is done on the existing model or the newly created model.

~~System Analysis And Design | Top 11 Differences You Should ...~~

The major goal of systems analysis and design is to improve organizational systems. Often this process involves developing or acquiring application software and training employees to use it. Application software, also called a system, is designed to support a specific organizational function or process, such as inventory management, payroll, or market analysis.

~~Systems Analysis and Design (SAD) Tutorial~~

The systems analysis phase is undertaken by one or more systems analysts and is used to identify the detailed system requirements in order to produce a requirements specification. This specifies what needs to be included in the new system to meet the system users'

System Design. Includes the design of application, network, databases, user interfaces, and system interfaces. Transform the SRS document into logical structure, which contains detailed and complete set of specifications that can be implemented in a programming language. Create a contingency, training, maintenance, and operation plan.
