current sub-prime crisis is merely the latest example. Much of this success is attributable to the increasing efficiency of the world's financial institutions as finance has proved to be one of the most important causal factors in economic performance. In a series of insightful essays, financial and economic historians examine how financial innovations from the seventeenth century to the present have continually challenged established institutional arrangements, forcing

change and adaptation by governments, financial intermediaries, and financial markets. Where these have been successful, wealth creation and growth have followed. When they failed, growth slowed and sometimes economic decline has followed. These essays illustrate the difficulties of coordinating financial innovations in order to sustain their benefits for the wider economy, a theme that will be of interest to policy makers as well as economic historians.

This book seeks to explain the global financial crisis and its wider economic, political, and social repercussions, arguing that the 2007-9 meltdown was in fact a systemic crisis of the capitalist system. The volume makes these

points through the exploration of several key questions: What kind of institutional political economy is appropriate to explain crisis periods and failures of crisis-management? Are different varieties of capitalism more or less crisis-prone, and can the global financial crisis can be attributed to one variety more than others? What is the interaction between the labour market and the financialization process? The book argues that

each variety of capitalism has its own specific crisis tendencies, and that the uneven global character of the crisis is related to the current forms of integration of the world market. More specifically, the 2007-09 economic crisis is rooted in the uneven income distribution and inequality caused by the current financial-led model of growth. The book explains how the introduction of more flexibility in the labour markets and financial

deregulation affected everything from wages to job security to trade union influence. Uneven income distribution and inequality weakened aggregate demand and brought about structural deficiencies in aggregate demand and supply. It is argued that the process of financialization has profoundly changed how capitalist economies operate. The volume posits that financial globalization has given rise to growing international imbalances,

which have allowed two growth models to emerge: a debt-led consumption growth model and an export-led growth model. Both should be understood as reactions to the lack of effective demand due to the polarization of income distribution. Taiwan, the Republic of China, has been striving to reform its financial system, and in the process, become a financial power, both regionally within the Pacific Rim of Asia, and

"The last 30 years have been dramatic for the financial services industry. In the 1990s and 2000s, boundaries between the traditional industry sectors, such as commercial banking and investment banking, broke down and competition became increasingly global in nature. Many forces contributed to this breakdown in interindustry and intercountry barriers, including financial innovation, technology, taxation, and regulation. Then in 2008-2009, the financial services industry experienced the worst financial crisis since the Great Depression. Even
