Valuation shows business appraisers and venture capitalists how to maximize their returns and avoid losing money—before the damage becomes irreparable.

This book provides an applied theoretical approach to modern day business valuation. It combines elements from both finance and accounting to help practitioners identify the most suitable method for analysis, showing when and how methods can be applied in different contexts and under specific constraints. It

describes how business valuation techniques can be applied to calculate value in case of transactions, litigation, IPOs, and the fair value under an IFRS framework. The purpose of this book is to offer a guideline for the application of an integrated approach, thereby avoiding "copy and paste" valuations, based on pre-packaged parameters and the uncritical use of models. Specifically, an Integrated Valuation Approach (IVA) should be adopted that encompasses, within any specific method,

online shops it appeared that 5 website value drivers are responsible for driving website worth. In this book you will learn to use a methodical approach in valuing a website using these 5 website value drivers. The different parts of the website valuation process will be discussed including a financial valuation and a qualitative valuation based upon the 5 website value drivers. You will learn to use this method in a practical way using a step by step approach. The book includes an example of the website valuation process using a fictitious website. In this book a distinction is being made

between information based websites and ecommerce websites. In calculating the worth of a website it makes a difference whether direct financial results are available or only attributable results. Even when no financial results are available a specific approach of calculating website worth is introduced. You will learn that with this new method of valuing a website every single website may be valued. Apart from explaining the method of valuing a website you will also learn some pitfalls you may encounter while trying to calculate a website's worth. At the end of the book we will get into the future of

Instruments is highly applicable to both professional accountants and auditors and students alike.

Risk management for financial institutions is one of the key topics the financial industry has to deal with. The present volume is a mathematically rigorous text on solvency modeling. Currently, there are many new developments in this area in the financial and insurance industry (Basel III and Solvency II),

but none of these developments provides a fully consistent and comprehensive framework for the analysis of solvency questions. Merz and Wüthrich combine ideas from financial mathematics (no-arbitrage theory, equivalent martingale measure), actuarial sciences (insurance claims modeling, cash flow valuation) and economic theory (risk aversion, probability distortion) to provide a fully consistent framework. Within this framework they then study solvency questions in incomplete markets, analyze hedging risks, and study asset-and-liability management questions, as well as issues like the limited liability options, dividend to

shareholder questions, the role of re-insurance, etc. This work embeds the solvency discussion (and long-term liabilities) into a scientific framework and is intended for researchers as well as practitioners in the financial and actuarial industry, especially those in charge of internal risk management systems. Readers should have a good background in probability theory and statistics, and should be familiar with popular distributions, stochastic processes, martingales, etc.

This book presents the main valuation approaches that can be used to value financial institutions. By sketching 1) the different

business models of banks (both commercial and investment banks) and insurance companies (life, property and casualty and reinsurance); 2) the structure and peculiarities of financial institutions' reporting and financial statements; and 3) the main features of regulatory capital frameworks for banking and insurance (ie Basel III, Solvency II), the book addresses why such elements make the valuation of financial institutions different from the valuation of non-financial companies. The book then features the valuation models that can be used to determine the value of banks and insurance companies including the Discounted Cash

Flow, Dividend Discount Model, and Residual Income Model (with the appropriate estimation techniques for the cost of capital and cash flow in financial industries). The main techniques to perform the relative valuation of financial institutions are then presented: along the traditional multiples (P/E, P/BV, P/TBV, P/NAV), the multiples based on industry-specific value drivers are discussed (for example, P/Pre Provision Profit, P/Deposits, P/Premiums, P/Number of branches). Further valuation tools such as the “Value Maps” or the “Warranted Equity Method” will be explained and discussed. The
