RESULTS AND CONCLUSIONS: HMGB-1 is associated with the development of inflammatory processes in the CNS caused by both tick-borne pathogens: viral (TBE) and bacterial (borreliosis). Measurement of the serum HMGB-1 concentration in the early stages of both diseases of the CNS may contribute to the differentiation between TBE and borreliosis. clinical impact for patients bitten by ticks.

~~Assessment of HMGB-1 concentration in tick-borne ...~~

In recent years, there has been increasing evidence of the emergence of tick-borne bacterial pathogens across Europe. This risk assessment was undertaken to determine

~~HAIRS risk assessment: emerging tick-borne bacteria in the ...~~

Lyme disease is the most common tick-borne disease in the United States and Europe. It is a spirochetal infection caused by *Borrelia* species (*Borrelia burgdorferi* in the US and primarily *Borrelia afzelii* and *Borrelia garinii* in Europe and Asia) and is transmitted by the bite of infected *Ixodes ricinus* complex ticks.

~~Evaluation of a tick bite for possible Lyme disease— UpToDate~~

Public Health England (PHE) can confirm the diagnosis of a case of babesiosis and a probable case of tick-borne encephalitis (TBE) in England. This is the first record of a case of TBE in England.

~~Rare tick-borne infections diagnosed in England— GOV.UK~~

Tick-borne encephalitis (TBE) is a viral infection involving the central nervous system in humans, and also (though rarely) in some animals. Until 2019, the causative agent was

~~Human Animal Infections and Risk Surveillance (HAIRS) group~~

RESULTS: Tick-borne encephalitis infections proved to be more clustered than those of LB which was widespread; however, the most prominent clusters of both diseases were
