In opposite to the USB AVR programmers, which can provide the power supply for the programmed chip, this programmer requires that the chip is supplied by an external power supply. Even more... this supply also must be connected to the "VTG" pin of the programmer.

 The AVR Dragon provides in-system serial programming, high-voltage serial programming and parallel programming, as well as JTAG or debugWIRE emulation for parts with 32 KB of program memory or less. ATMEL changed the debugging feature of AVR Dragon with the latest firmware of AVR Studio 4 - AVR Studio 5 and now it supports devices over 32 KB of program memory.

 AVR programming works in a similar way. Instead of pads, the chip is often placed in a circuit board which has header pins that the progammer plugs into, the header pinout is standardized so that any programmer can be used once the header is wired up correctly. There are two standards for AVR in-system programming:
