COMPLEX PTSD - FROM SURVIVING TO THRIVING Complexity Of Coalition Structure Generation

In the coalition structure generation problem, the goal is to find a coalition structure of N that maximizes the social welfare $P(C)$. We will refer to this problem of finding an optimal coalition structure as OptCS. In this paper, we conduct a detailed investigation of computing optimal coalition structures that give the maximum social ...

Complexity of coalition structure generation

Abstract: We revisit the coalition structure generation problem in which the goal is to partition the players into exhaustive and disjoint coalitions so as to maximize the social welfare. One of our key results is a general polynomial-time algorithm to solve the problem for all coalitional games provided that player types are known and the number of player types is bounded by a constant.

[1101.1007] Complexity of coalition structure generation

Then, the complexity of coalition structure generation over valuation structures is studied, by assuming that the functions associating each coalition with its worth are given as input according ...

The coalition structure generation problem can then be modeled as: Maximize $\sum_{j=1}^{2^n} v(C_j) \prod_{i \in C_j} x_i$ subject to $\sum_{j=1}^{2^n} z_{i,j} \prod_{k \in C_j} x_k = 1$ for $i = 1, 2, \dots, n$ $x_j \in \{1, 0\}$ for $j = 1, 2, \dots, 2^n$ With this formulation, it is possible to apply any integer programming solver.

~~Graph Coalition Structure Generation - deepai.org~~

We give the first analysis of the computational complexity of coalition structure generation over graphs. Given an undirected graph $G=(N,E)$ and a valuation function $v:2^N \rightarrow \mathbb{R}$ over the subsets of nodes, the problem is to find a partition of N into connected subsets, that maximises the sum of the components' values.

We give the analysis of the computational complexity of coalition structure generation over graphs. Given an undirected graph $G = (N,E)$ and a valuation function $v : P(N) \rightarrow \mathbb{R}$ over the subsets of nodes, the problem is to find a partition of N into connected subsets, that maximises the sum of the components values.

~~Coalition Structure Generation over Graphs - NASA/ADS~~

Coalition formation is an important capability in automated negotiations among self-interested agents. Coalition structure generation (CSG) involves partitioning a set of agents into coalitions to maximize social surplus. This problem has become a popular research topic in AI and multi-agent systems (MAS) [4].
