*Computational Analysis and Design of Bridge Structures* covers the general aspects of bridges, bridge behavior and the modeling of bridges, and special topics on bridges. This text explores the physical meanings behind modeling, and reveals how bridge structures can be analyzed using mathematical models.

by developing multi-objective optimisation methods to support engineering design; by investigating the analysis and design of nuclear reactor systems. The research approach and methodology is to develop effective integrated computational design approaches (integrating search, optimisation and analysis tools) for particular applications from industry, and then, where possible and appropriate, to generalise

these to other applications and industrial sectors.

Computational Analysis Computational analysis is recommended as a way to design more complicated geometries for the positioning of permanent magnets, the flowing tube's path or the filling mesh able to bring the absolute 100% separation of magnetic nanoparticles from drinking water.

We propose a computational approach for designing functional antibodies by focusing on functional epitopes, integrating large-scale statistical analysis with multiple structural models. Machine learning is used to analyze these models and predict specific residue-residue contacts. We use this approach to design a functional antibody to counter the proinflammatory effect of the cytokine interleukin-17A (IL-17A).
