Cyber threat actors continue to exploit unpatched software to conduct attacks against critical infrastructure organizations. As many as 85 percent of targeted attacks are preventable [1] . This Alert provides information on the 30 most commonly exploited vulnerabilities used in these attacks, along with prevention and mitigation recommendations.

Top 30 Targeted High Risk Vulnerabilities | CISA

An exploit is a piece of software, a chunk of data, or a sequence of commands that takes advantage of a bug or vulnerability to cause unintended or unanticipated behavior to occur on computer software, hardware, or something electronic. Such behavior frequently includes things like gaining control of a

computer system, allowing privilege escalation, or a denial-of-service attack.

Exploit (computer security) - Wikipedia

Nigel Thorpe, technical director at SecureAge, looks at the growing cyber security threats to global governments and suggests that it is time for a new approach to data protection. In mid-September, UK Foreign Secretary Dominic Raab condemned the continued Chinese attacks on telecoms, tech and global governments.

Cyber security threats against global governments increase ...

In cyber security, a vulnerability is a weakness which can be exploited by a cyber attack to gain unauthorized access to or perform unauthorized actions on a computer system. Vulnerabilities can allow attackers to run code, access a system's memory, install malware, and steal, destroy or modify sensitive data.

What is a Vulnerability? | UpGuard

Following our previous analysis of the likely cyber threat consequences of the COVID-19 crisis, we look at how efforts to accommodate remote working have also increased attack surfaces. Following the UK government's advice in response to the COVID-19 crisis, businesses from many sectors have transitioned to remote working.
