 Fuses are simply a length of wire attached between two terminals and covered in a non-combustible material sleeve. They are a safety feature required in all modern electrical devices. The main purpose of a fuse is to fail, but only when too much electrical current is passed through the wire.

*Guide to Fuses - DIY Extra*  
 However, you also do not want the fuse to keep blowing under normal operation (known as a nuisance blow), so the two elements to consider are: The current rating of the smallest cable in the circuit The current draw on the circuit under normal expected operating conditions

 Fuses are safety devices used in an electric plug or circuit, made of a wire components inserted in a non-combustible housing. Their function is to prevent the damages induced by an overflow of electrical current, by overheating and melting the wire inserted in the housing whenever there is a fault, consequently interrupting the electrical flow.

 Automotive fuses are a class of fuses used to protect the wiring and electrical equipment for vehicles. They are generally rated for circuits no higher than 32 volts direct current, but some types are rated for 42-volt electrical systems. They are occasionally used in non-automotive electrical products.
