Maxima Tutorial

So a brief Tutorial of how Maxima works: 1) Open up wxMaxima. You should see a big blank screen and maybe some buttons somewhere (if you don't see the buttons labeled "simplify" and such, go to Maxima > Panes > General Math). 2) Type in a basic arithmetic problem using +, -, *, / and whatever numbers you want and press shift+enter.

wxMaxima Introduction

Maxima distinguishes lower and upper case. All built-in functions have names which are lowercase only (sin, cos, save, load, etc). Built-in constants have lowercase names (%e, %pi, inf, etc). If you type SIN(x) or Sin(x), Maxima assumes you mean something other than the built-in sin function. User-defined functions and variables can have names

Maxima is a computer algebra system, implemented in Lisp. Maxima is derived from the Macsyma system, developed at MIT in the years 1968 through 1982 as part of Project MAC. MIT turned over a copy of the Macsyma source code to the Department of Energy in 1982; that version is now known as DOE Macsyma. A copy of DOE

Maxima Manual - University of Cambridge

A 10 minute tutorial for solving Math problems with Maxima by Antonio Cangiano Macsyma's General Simplifier: Philosophy and Operation by Richard Fateman, first published in the Macsyma Users Conference, Washington D.C. 1979, in: MUC-79, 563-582.

Maxima can preprocess, you can use the plot command. All the remaining types of plots are preprocessed by the third-party draw package. draw's preprocessing involves creating a scene out of graphic objects. Examples of graphic objects include parametric plots, implicit plots, and explicit plots. Graphic objects are combined with

The Maxima package draw in the wxMaxima GUI Version 0

Maxima is a system for the manipulation of symbolic and numerical expressions, including differentiation, integration, Taylor series, Laplace transforms, ordinary differential equations, systems of linear equations, polynomials, sets, lists, vectors, matrices and tensors. Maxima yields high precision numerical results by using exact fractions, arbitrary-precision integers and variable-precision floating-point numbers.

In maxima it is useful to reference a matrix that you have put into the sketch previously. To do this all you need to do is put a letter and then a colon in front of the command matrix to call it for further use during the sketch. Now the sketch known's that m for instance is the matrix you are calling.

wxMaxima - documentation

In Maxima Tutorial 1, we have discussed how Maxima can be used to perform numerical computations. In this tutorial, we are going to enumerate some of the capabilities of Maxima to perform symbol manipulation. Note than in each equation below, do not forget to press the ENTER key after the semicolon.

One of them, called the browser, shows a tutorial and allows the user to read the manual or other Web pages. The second window is the console, where Maxima commands should be written and their output will appear.

Dynamics and Dynamical Systems - Maxima Tutorial

The instruction subst instructs Maxima to substitute a list of equations appearing as the first argument of subst , enclosed in square brackets, into the expression appearing as its second argument. Maxima 's default is to produce exact calculations, not numeric approximations. Thus, $da/dt = 14400$.
