In summary, the regression models discussed in previous studies refer to either Type I models, with components of compositional data as explanatory variables, or Type II models, with dependent variable of compositional data and the independent variables of real data. Little attention, however, has been placed on the regression model for compositional data as explained and explanatory variables.

The models and algorithms allow us to determine the key factors for a robust service composition scheme in NFV including the dynamic resource allocation and network capacity design. The numerical and experimental results under both generated network topologies and real world datasets validate the cost effectiveness of our solution.

In statistics, compositional data are quantitative descriptions of the parts of some whole, conveying relative information. Mathematically, compositional data is represented by points on a simplex. Measurements involving probabilities, proportions, percentages, and ppm can all be thought of as compositional data.
