The Foreign quarterly review [ed. by J.G. Cochrane]. Stranded II: Return to PlusarLulu Press, Inc

Humanity is the sum of the arts and sciences. But the equation doesn't balance. For how do we explain the synergy that makes the whole greater than the sum of the parts? How do we define a sense of wonder? What is the formula for the meaning of life? Like Einstein's Cosmological Constant, that indefinable spark of mystery that makes the universe something more than merely possible, there is an unqualifying element that breathes life into our ideas and perceptions, lifting us up above the mundane: The RH Factor.

Recognized as two of the world's leading authorities on the subject, Susan Herdman and Richard Clendaniel, joined by a team of expert contributors, deliver the 4th Edition of the field's definitive text on the management of vestibular diseases and disorders. From assessment through therapy, they present the scientific and clinical knowledge you need to distinguish between vestibular and non-vestibular dizziness and to plan and implement the appropriate treatments.

This important and exciting title represents the first authoritative volume focussed on pelagic (open ocean) sharks as a group. Virtually every pelagic shark expert in the world has contributed to this landmark publication which includes the latest data and knowledge on pelagic shark biology, fisheries, management, and conservation. Pelagic sharks face unprecedented levels of exploitation in all the world's oceans through both direct fisheries and by-catch, and effective management for these species is contingent upon solid science and data, which this book brings together for the first time. All those involved in shark biology will need to have a copy of this book.

Many factors may influence the release of neurotransmitters from airway nerves [1]. This is likely to be important in physiological control of airway functions and may be particularly relevant in airway diseases, such as asthma and chronic obstructive

pulmonary disease (COPD). Neural elements in airways interact in a complex manner and the activation of certain neural pathways may profoundly influence the release of transmitters from other neural pathways. Similarly inflammatory mediators released from inflammatory cells in the airways may also modulate neurotransmitter release. There are marked differences between species in airway innervation and in neuromodulatory effects and, wherever possible, studies in human airways have been emphasised, although information on neuromodulation in human airways is somewhat limited at present. Release of neurotransmitters from nerve terminals occurs via a Ca^{2+} dependent secretion evoked by a nerve action potential, but may also be evoked experimentally by a high extracellular K^+ concentration which directly depolarises the nerve terminal membrane. Modulation refers to the alteration of neurotransmitter release, which may either be increased (facilitation) or reduced (inhibition) by the action of a particular agent, thus changing the magnitude of the neurally-mediated response. Such agents would normally act on receptors on the nerve terminal which are referred to as pre-junctional (or presynaptic) receptors, in contrast to post-junctional (or post-synaptic) receptors located on the target cells which are influenced by that particular transmitter.

Now in one convenient volume, *Vocal Health and Pedagogy: Science, Assessment, and Treatment, Third Edition* answers every question you've ever had about the voice, from the physics of sounds, to vocal technique, to medications, to performance anxiety. It presents anatomical, physiological, and neurological considerations, as well as covers critical issues related to patient history, laryngeal function, the physical examination, and historical perspectives of vocal pedagogy. The first part of the book introduces basic concepts of voice science, assessment, and training. It focuses on the science behind the common problems that afflict voice users and enables understanding of the medical approach to problem analysis. The second part of the book contains additional information on the specific health and performance conditions that affect the voice and their assessment and treatment. It considers the medical and nonmedical issues affecting the human voice, including diagnosis and treatment of voice problems, the effects of physical injury, posture, pollutants and irritants, psychological effects, voice therapy, medication, and more. New to this edition: New chapters on topics such as pedagogy for children, the importance of studying music, laryngeal issues involving wind instrument performance, high-speed digital imaging, the evolution of technology, pediatric voice disorders, thyroid disorders, the vocal effects of birth control medications, and

autoimmune disorders. Many chapters have been extensively revised to update previous content and add new information on material such as choral pedagogy for geriatric singers, World Trade Center syndrome, and laryngeal effects of asbestos exposure. Chapters on medications for performers have been revised to delete medications no longer used frequently and to add various medications and drug classes that were not included previously, as well as information on alternative and complementary medicines. References have been updated throughout to include discussion of new studies and a review of the latest literature, while also retaining the classic literature. Includes the most recent practices and techniques, the latest information on surgical and adjunctive therapy, and important changes in criteria and strategy. *Vocal Health and Pedagogy: Science, Assessment, and Treatment, Third Edition* is ideal for courses in vocal pedagogy and speech-language pathology. Additionally, it is a valuable resource for professional and amateur performers and their teachers.

Co-edited by Eugene N. Myers, a world-famous expert in the field, this has got to be the last word on salivary gland disorders. The disorders themselves cover a broad array of diseases, both benign and malignant. Thus, the contents of this book have been organized to reflect the diverse nature of salivary gland anatomy, physiology, and dysfunction in various states of disease. In this way, the evolution of the field

and its diagnostic and therapeutic management are better demonstrated. Covering everything from practical diagnosis to gland tumor therapy, this really is a crucial work for any surgeon working in the facial or neck regions.

This volume provides a selection of the most significant papers presented at the Second Conference on Fish Telemetry in Europe in La Rochelle, France, in April 1997. The conference was attended by 100 scientists from 18 countries. The contributions are grouped under the following headings: Methodology and New Developments, Tagging Procedures, Behavioural and Physiological Ecology, Fish Migration, Stock Management and Conservation. Particular emphasis was put on tag miniaturisation, multiple functions and sampling strategies. Papers concerned the effects of tags on fish for consolidating behavioural or original physiological investigations noticeably more open to the marine environment. Methods were essentially applied to study the relationships between fish and their natural environment. Besides

providing up-to-date information on the state of fish telemetry, the book illustrates the increase in spatial and temporal scales and the number of tracked fish which gives a statistical basis for field study in behavioural ecology.

This book provides a comprehensive description of the pathology of the head and neck region, concentrating especially on those pathologic entities that are unique to or characteristic of the head and neck. The new edition retains the ten chapters of the first edition, all updated and improved, and additionally contains seven entirely new chapters and a more detailed subject index. The number of illustrations has been substantially increased, and various lesions absent in the original edition have been included. Throughout, attention is paid to correlation of pathology with epidemiology, clinical features, pathogenesis, and molecular genetics. Differential diagnosis is addressed, and information is also provided on staging, prognosis, and therapy. The authors include foremost experts in the field, some of whom are senior members of the Working Group on Head and Neck Pathology of the European Society of Pathology.

Back on Mars, General Eric Eichstaedt and Alana McGovern, the other two members of the original crew that crash landed on Ganymede two years ago, are informed of the incident and immediately take off in a rescue ship. They manage to land safely near the village of the Latosians, the one-eyed humanoids whom they befriended on their first visit. Together they battled the Elas and another alien race that has teamed up with the Elas called Zepols.
