

Re E Sacerdoti Vol li La Vocazione Pi Alta Volume 2

This book discusses the application of some Artificial Intelligence (AI) technologies to database systems. The integration of AI technology and database management has developed into an important research topic, and many AI methods, such as logic programming, natural language understanding, knowledge-bases, etc., have been applied to the development of intelligent database systems capable of deduction, natural language query understanding, cooperative query answering, and substantial query guidance. In this book, the authors review some knowledge-base assisted database access techniques, incorporating techniques to form a new kind of database front-end. The results of these applications are summarized and explained. Contents: Natural Language, Knowledge, and Database Knowledge-Based Natural Language Front-End Knowledge-Based Database Assistant Semantic Network Models Manipulation of User Misconceptions in Database Retrieval Cooperative Answers to Indirect Queries Knowledge-Base for Null Events Readership: Computer scientists. keywords: Natural Language; Knowledge-Base; Database Assistant; Semantic Network Models; User Beliefs and Misconceptions; Cooperative Answers to Indirect Queries; Handling Null Events

Reprint of the original, first published in 1866.

Chi conosce la storia del Graal e dei cavalieri della Tavola Rotonda soltanto attraverso il Parsifal di Richard Wagner o le divagazioni di certi ambienti "spiritualistici", il film Excalibur di John Boorman o i moderni romanzi di "fantasy" da questo libro di Julius Evola sar  condotto in un mondo insospettato e suggestivo, ricco di simboli, di elementi metafisici e di significati profondi.

Artificial Intelligence in Engineering Design, Volume II: Models of Innovative Design, Reasoning About Physical Systems, and Reasoning About Geometry focuses on the processes, programs, techniques, and technologies involved in the employment of artificial intelligence in engineering design. The selection first takes a look at the automated reuse of design plans in BOGART and ARGO, an analogical reasoning system for solving design problems. Topics include analogy mechanisms

in ARGO, analogical reasoning and learning, ARGO development environment, using VEXED to construct a design plan, and how BOGART reuses a design plan. The text then ponders on retrieval strategies in a case-based design system and case-based design, including the functions-to-structure design task in the domain of physical devices, design retrieval, proposition, and modification, and the multi-layered case representation. The publication examines mechanism comparison and classification for design; a case-based approach to the design of mechanical linkages; and studies of heuristic knowledge-based approaches for automated configuration generation and innovation. Topics include applications of stress field estimation to geometric optimization, simplification and abstraction operators, mechanism comparison and classification, linkage synthesis, analytic synthesis techniques, and system architecture. The selection is a valuable reference for readers interested in the use of artificial intelligence in engineering design.

Professional knowledge management is imperative for the success of enterprises. One decisive factor for the success of knowledge management projects is the coordination of elements such as corporate culture, enterprise organization, - man resource management, as well as information and communication techn- ogy. The proper alignment and balancing of these factors are currently little understood—especially the role of information technology, which is often - garded only as an implementation tool, though it can be a catalyst by making new knowledge management solutions possible. This conference brought together representatives from practical and research ?elds for discussing experiences, professional applications, and visions through presentations, workshops, tutorials, and an accompanying industry exhibition. The main focus of the conference was the realization of knowledge mana- ment strategies with the aid of innovative information technology solutions, such as intelligent access to organizational memories, or integration of business processes and knowledge management. Also of interest were holistic/integrative approaches to knowledge management that deal with issues raised by the in- gration of people, organizations, and information technology.

Five years ago, with excitement and uncertainty, we witnessed the birth of PRIMA (Paci?c Rim International Workshop on Multi-Agents). The ?rst PRIMA in 1998 has now grown into PRIMA 2003, the 6th Paci?c Rim Inter- tional

Workshop on Multi-Agents in Seoul, Korea. During a period of 7 years, the notion of agent research has grown so much that we hear the term agent on a daily basis. Various fields such as business, the Web, software engineering, on-line games and such are now using the term agent as a placeholder, just like the term object is used in the object-oriented paradigm. On the other hand, the research area has extended toward real applications, such as the Semantic Web and ubiquitous computing. The themes of PRIMA 2003 reflected the following trends: – agent-based electronic commerce, auctions and markets – agent architectures and their applications – agent communication languages, dialog and interaction protocols – agent ontologies – agent programming languages, frameworks and toolkits – agent cities – agents and grid computing – agents and peer computing – agents and the Semantic Web – agents and Web services – artificial social systems – conflict resolution and negotiation – evaluation of multi-agent systems – languages and techniques for describing (multi-)agent systems – meta modeling and meta reasoning – multi-agent planning and learning – multi-agent systems and their applications – social reasoning, agent modeling, and organization – standards for agents and multi-agent systems – teams and coalitions – ubiquitous agents

Automated fault analysis is not widely used within chemical processing industries due to problems of cost and performance as well as the difficulty of modeling process behavior at needed levels of detail. In response, this book presents the method of minimal evidence (MOME), a model-based diagnostic strategy that facilitates the development and implementation of optimal automated process fault analyzers. With this book as their guide, readers have a powerful new tool for ensuring the safety and reliability of any chemical processing system.

Harmony of the Law - Volume II

Text-book of Ecclesiastical History

Collezioni etnografiche del Museo Borgiano, memoria del dott. G.A. Colini ...

The Popes of Rome

This book provides a thorough legal analysis of sovereign indebtedness, examining four typologies of sovereign debt – bilateral debt, multilateral debt, syndicated debt and bonded debt – in relation to three crucial contexts: genesis, restructuring and litigation. Its treatise-style approach

makes it possible to capture in a systematic manner a phenomenon characterized by high complexity and unclear boundaries. Though the analysis is mainly conducted on the basis of international law, the breadth of this topical subject has made it necessary to include other sources, such as private international law, domestic law and financial practice; moreover, references are made to international financial relations and international financial history so as to provide a more complete understanding. Although it follows the structure of a continental tractatus, the work strikes a balance between consideration of doctrinal and jurisprudential sources, making it a valuable reference work for scholars and practitioners alike.

Explanation-Based Learning (EBL) can generally be viewed as substituting background knowledge for the large training set of exemplars needed by conventional or empirical machine learning systems. The background knowledge is used automatically to construct an explanation of a few training exemplars. The learned concept is generalized directly from this explanation. The first EBL systems of the modern era were Mitchell's LEX2, Silver's LP, and De Jong's KIDNAP natural language system. Two of these systems, Mitchell's and De Jong's, have led to extensive follow-up research in EBL. This book outlines the significant steps in EBL research of the Illinois group under De Jong. This volume describes theoretical research and computer systems that use a broad range of formalisms: schemas, production systems, qualitative reasoning models, non-monotonic logic, situation calculus, and some home-grown ad hoc representations. This has been done consciously to avoid sacrificing the ultimate research significance in favor of the expediency of any particular formalism. The ultimate goal, of course, is to adopt (or devise) the right formalism.

I riti della Settimana Santa oggi, nella provincia di Siracusa volume 1

Over the last twenty years, automation and robotics have played an increasingly important role in a variety of application domains including manufacturing, hazardous environments, defense, and service industries. Space is a unique environment where power, communications, atmospheric, gravitational, and sensing conditions impose harsh constraints on the ability of both man and machines to function productively. In this environment, intelligent automation and robotics are essential complements to the capabilities of humans. In the development of the United States Space Program, robotic manipulation systems have increased in importance as the complexity of space missions has grown. Future missions will require the construction, maintenance, and repair of large structures, such as the space station. This volume presents the

efforts of several groups that are working on robotic solutions to this problem. Much of the work in this book is related to assembly in space, and especially in-orbit assembly of large truss structures. Many of these so-called truss structures will be assembled in orbit. It is expected that robot manipulators will be used exclusively, or at least provide partial assistance to humans. Intelligent Robotic Systems for Space Exploration provides detailed algorithms and analysis for assembly of truss structure in space. It reports on actual implementations to date done at NASA's Langley Research Center, The Johnson Space Center, and the Jet Propulsion Laboratory. Other implementations and research done at Rensselaer are also reported. Analysis of robot control problems that are unique to a zero-gravity environment are presented.

This work collects together the names of Isis worshippers known from epigraphical evidence with the intention of showing the value of this underrated source when used systematically rather than episodically. The statistical study of the interest shown by women in the cult and of the diverse group of gods worshipped are only two examples of the research which this prosopography hopes to encourage.

Towards Mechanized Mathematical Assistants

This book constitutes the joint refereed proceedings of the 10th International Conference on Artificial Intelligence and Symbolic Computation, AISC 2010, the 17th Symposium on the Integration of Symbolic Computation and Mechanized Reasoning, Calculemus 2010, and the 9th International Conference on Mathematical Knowledge Management, MKM 2010. All submissions passed through a rigorous review process. From the 25 papers submitted to AISC 2010, 9 were selected for presentation at the conference and inclusion in the proceedings volume. A total of 14 papers were submitted to Calculemus, of which 7 were accepted. MKM 2010 received 27 submissions, of which 16 were accepted for presentation and publication. The events focused on the use of AI techniques within symbolic computation and the application of symbolic computation to AI problem solving; the combination of computer algebra systems and automated deduction systems; and mathematical knowledge management, respectively.

This is the second of three volumes exploring some of the most remarkable insights into Ancient Egypt to have come to light in modern times. The first two volumes deal with the Rosetta Stone, an outstanding archaeological discovery which has supplied the basis for Egyptian decipherment; the final volume explores the "Stele of Canopus", discovered in 1866. The significance of the Rosetta Stone lies in the three different languages inscribed on it: Koine Greek, Demotic Egyptian, and, crucially, Hieroglyphic. This has facilitated a vast increase in our understanding of the sacred language of Ancient

Egypt, as well as enhancing our understanding of the nature of kingship at a time of immense cultural transformation. First published in 1904, this title provides an accessible general introduction to this fascinating subject, useful for the amateur enthusiast as well as undergraduate students.
