This approach, however, considers two hypotheses instead of one, namely the prosecution and defense hypotheses: H_p : The suspect is the contributor of the DNA sample, H_d : A random man is the contributor of the sample. The LR is generally defined as (1) $LR = \frac{P(\text{DNA Evidence } E | H_p)}{P(\text{DNA Evidence } E | H_d)}$.

~~On statistical analysis of forensic DNA: Theory, methods ...~~

Statistical DNA Forensics sets out to provide a practical guide to the analysis of DNA evidence. The authors present an overview of the essential statistical methodology and computational techniques used in analyzing DNA evidence. Basic genetics and elementary statistics are introduced, enabling readers from either discipline to understand complex forensic cases and make use of the advanced topics presented. The book: Presents a systematic, case study-based, analysis of key forensic DNA ...
