ASTM D2850, D4767, D7181; AASHTO T-297; BS 1377-7, BS 1377-8. Determining the mechanical properties of soils is a very important step to design foundations, embankments and other soil structures. Constructions, excavations, tunnelling and similar applications have several effects on the subsoil structures and these effects are successfully simulated with Triaxial Tests where the stress-strain relationships of soil specimens are investigated by subjecting the soil sample to ...

ASTM D7181. Significance and Use. The shear strength of a saturated soil in triaxial compression depends on the stresses applied, time of consolidation, strain rate, and the stress history experienced. In this test method, the shear characteristics are measured under drained conditions and are applicable to field conditions where soils have been fully consolidated under the existing normal stresses and the drained conditions similar to those in the ...
