Guide

In a cluster, two or more servers (called nodes) are linked in a network. These servers run the cluster software that allows each node access to the shared disks. If a node becomes unavailable, cluster resources migrate to an available node (this process is called failover). The shared disks and the virtual server are kept available.

cluster communication links to avoid single points of failure.

Veritas Cluster Server

This plug-in allows Geneos users to monitor the Veritas Cluster Server system, specifically information relating to service group and system status, resources used by service groups and the attributes of those resources, and heartbeat links status. Information is extracted by running a number of Veritas executables and parsing their output.
